/Introduction

KabiStory is the platform for the private trust management market, built on blockchain technology and smart contracts. We unite exchanges, brokers, traders, and investors into a decentralized, open and fair network, making the financial market even more global. This will allow successful traders to rapidly scale their trading strategies by attracting investments from around the world. The smart contract technology that underlies the platform will provide an automated and absolutely transparent system for investment and profit distribution. We have our own complete ecosystem, and we also have our own games, which have been developed, aiming to become a better benchmark in Tokens.

Our Advantage

KabiStory is a decentralized trust management platform built on blockchain technology and smart contracts. Blockchain technology provides indispensable advantages, such as openness, immutability, and censorship-resistance of all stored information, whereas smart contracts, which will be carrying out investment and profit distribution, make these processes completely transparent and open. Each manager in the KabiStory network has his own cryptocurrency. The size of the issue depends on successful trade statistics. The process of transferring funds to the manager is carried out by buying a manager's cryptocurrency on the internal exchange. From manager's point of view, the trade process will not change. The trader will continue to operate on the exchange or through a convenient broker. KabiStory, in turn, represents a common open source of reliable information about the statistics of the network participants' activities and an absolutely transparent system of investment and profit distribution, built on smart contracts. We handle it very well. We believe that in this healthy system, everyone can enter into it and gain vested interests. This is what we want to see and what we want to see. We always believe What can you gain from this Token .

Token Economics

Total supply: 1 billion

Pool liquidity: 10B

Transaction fee: 2% buy in (return liquidity pool)

Sell 3% (return to liquidity pool)

Slippage: 10%

NFT tax: 5%

-90% return to the liquidity pool

-10% marketing wallet

Self-defense: automatically block the robot's buying address / prohibit block trading

Trading limits: the maximum purchase limit is 2B, the minimum purchase limit is 0.1B

Detailed Process Description

During the reporting period, the manager trades on his or her trading platform with the amount of funds available at the beginning. The history of its trading is unloaded from the trading platform and recorded in IPFS in real time.

The manager can leave a request for deposit/ withdrawal of his own funds from his trading account, which will be processed at the end of the reporting period. In this case, the amount of remaining funds should not be less than the minimum amount.

Investors can buy the manager's coins on the primary market for KabiStory. In this case, the transaction is recorded in the manager's smart contract and will be implemented at the end of the reporting period.

Investors can freely transfer and sell their coins on the internal exchange.

Investors can leave requests for withdrawal of their invested funds, which will be processed at the end of the reporting period.

Capturing the Market

Our partners' companies have been engaged in technological maintenance and software development for brokerage companies, mainly in foreign exchange markets. Their experience allows them to integrate all of the necessary software into the industry without unnecessary costs and delays or difficulties from the broker's side. For example our partner Tools For Brokers inc. is servicing more than 250 companies from thirty different countries (35% - Europe, 35% - Asia, 25% - Middle East, 5% - Others).

Possible Problems and Their Solutions

Blockchain restrictions

Token sale and KabiStory platform prototype development will take place on Binance platform. We have chosen Binance because it is currently the most popular and functional blockchain platform. However, Binance has a number of serious and well-known flaws, the most critical being its lack of scalability and its high transaction cost.

At the early stage of our project, it's not a serious problem. However, the expected scale of KabiStory platform, according to the number of our potential broker clients, represents tens of thousands of managers, hundreds of thousands of investors, and millions of transactions. This level of load currently cannot be handled by Binance.

Despite Binance's flaws, we love its technology and are following its development plans closely. Vitalik Buterin has already announced many promising features in Binance's upcoming versions. We hope that these features will be able to improve the current situation.

At the moment, we are continuing our platform development, based on Binance. But in case we reach Binance's capabilities' limit (presumably it can happen in a one-year period), we can decide to switch to another blockchain, which will be able to meet the needs of the project.

Blockchain technologies are developing rapidly, and there are already some promising alternatives.

Allocation of Funds

KabiStory Token Economics

Only 5% belong to the Team, all others join into Pancake Liquidity Pool.

Development Plan

The budget and components are planned, assuming that our fundraising efforts will reach the estimated maximum amount. Otherwise, a part of the components will have to be abandoned, and the budget will be reduced for the remaining features.
